CampusSignal demo: copy & paste sheet

Everything to type during the demo, in order. Yellow boxes are the exact text to paste. If line breaks sneak in when you copy from this PDF, use the matching .txt file instead.

1. Log in as Amaka

Open the app, click **Sign in**, then choose **Amaka Okafor** under the demo learners.

Say: “Meet Amaka. She studies Computer Science at MIVA while working full time, and she hasn’t touched her module in six days.”

2. Coach: admit you’re stuck

Go to **Coach** and tap the **I’m stuck** quick reply (nothing to paste). The coach points her to Phone a Friend.

3. Phone a Friend: ask Tunde

Go to **Phone a Friend** and click **Ask Tunde**. Fill in the two fields:

WHAT ARE YOU WORKING ON? · Amaka

REST APIs: protecting a route with authentication

WHERE DID YOU GET STUCK? · Amaka

I added auth middleware to my Express app to protect GET /api/tasks. I log in and get a token, but when I call the protected route with curl it always returns 401 Unauthorized. I’ve checked the token isn’t expired, so I’m not sure if I’m sending the Authorization header wrong or the middleware is reading it wrong.

Click **Send request**.

4. Switch to Tunde and accept

Click **Switch persona** → **Tunde Adeyemi**. Open the request from the banner on his home screen, then click **Accept request**. Send this in the chat:

CHAT MESSAGE · Tunde

Hi Amaka! A 401 with a valid token usually means the header format is off. It should be Authorization: Bearer YOUR_TOKEN, with the word Bearer, a space, then the token. Also check your middleware reads it like this: req.headers.authorization?.split(" ")[1]

Click **I’m done — mark complete**.

5. Back to Amaka and complete

Switch persona → **Amaka Okafor** → **Phone a Friend** → open the conversation. Optionally reply first:

CHAT MESSAGE (OPTIONAL) · Amaka

That was it! I was missing the word Bearer. Getting a 200 now, thank you!

Click **I’m done — mark complete**. The UNSTUCK stamp lands for both learners.

6. Import the module outline PDF

Go to **My campus** → **Add a module**. Type the title *first* (otherwise the PDF file name is used):

> **MODULE TITLE**
> REST, Auth & Testing

Click **Choose File** and pick **CSC204-REST-Auth-Testing-module-outline.pdf**, then **Find my outcomes**. Six lines come back. Remove the first two, the course title and “Learning outcomes”, by clicking the **×** next to **Outcome 1** twice. The four real outcomes stay. Click **Confirm & create my restart**.

Say: “Outcomes only ever come from her own text. She removes what isn’t an outcome and confirms the rest.”

7. Submit the restart evidence

Her restart outcome is **Build a REST endpoint that returns JSON**. Optionally click **Start my 12 minutes**, then paste into **Show your small step**:

> **SHOW YOUR SMALL STEP · Amaka**
> I built a REST endpoint in Express: GET /api/tasks returns a JSON list of tasks. I tested it with curl and got a 200 response with the expected data. I learned that res.json() sets the Content-Type header for me.

Leave Photo URL empty and click **Submit my proof**. It meets all three checks: a long enough description, it uses words from the outcome (REST, endpoint, JSON) and it gives a result (200 response, “I learned”). The RESTARTED stamp appears.

8. Finish

Open **Stamps** to show both stamps, then **Profile** for the privacy controls. Optionally switch to the dark theme.

Say: “CampusSignal: a little momentum, a nearby friend, and a way forward for working learners. Free to run, with no paid services required.”

Tip. Running the demo twice

Each run adds new requests and stamps to the demo learners. For a clean second take, use a fresh local database, or just continue: the flow still works, and the stamps simply add up.
